

Microsoft Azure Pack Integration

Activating the Integration with Azure Pack

For the automatic provisioning of Azure Pack services, we have implemented a service manager that handles the provisioning of the services to the end customers.

Defining your IaaS Offerings

In interworks.cloud platform you can define your IaaS offerings and their add-ons by creating products of type **Azure Pack**.

Ordering an IaaS offering

The ordering process for a product with product type **Predefined packages interworks.cloud Azure Pack** is similar with the process of any other cloud application. The customer must select one of the product you have created and published in your Storefront and complete his order by checking out his basket.

The ordering process for a product with product type **interworks.cloud Azure Pack** is conducted with the use of a wizard where the customer can select the desired configuration and complete his order by checking out his basket.

Managing Azure Pack Subscriptions

When a storefront user purchases an Azure Pack Subscription, the administration of the subscription takes place through the WAP Portal. The customer can find a shortcut to the WAP Portal through the **Workspace** tab of your Storefront.
