

NetSuite Connector

NETSUITE

Supported versions: *Any version on [NetSuite.com](https://www.netsuite.com)*

Supported Synchronization Options: *Accounts, Invoices, Products, Payments*

NetSuite API settings

NetSuite do not support REST calls out of the box, but instead they provide the tools to expose the parts of their "API" that are needed.

Activating the NetSuite Connector

The activation of the integration connector can be done from BSS Setup. For creating a new NetSuite instance you must navigate to **BSS > Setup > System Options > Systems Setup** and select the **Activate** action for the NetSuite connector. You will be asked to set a unique name for the new instance that will be created.

NetSuite Supported Push and Pull Methods

This page explains which are the Push and Pull methods supported by NetSuite connector. Push are the methods where interworks.cloud platform sends information to NetSuite and pull are the methods where we get information from NetSuite. For each method the data transformation schema is explained.

	Push			Pull	
	Create	Update	Delete	Create	Update
Account	✔	✔		✔	✔
Invoices	✔	✔			
Products	✔	✔			
Payments	✔	✔			

Customizing and Testing the NetSuite Connector

If you want to extend or amend the out-of-the-box functionality that is offered from our NetSuite connector, you can do so from the "**edit integration**" page. The extensions you can do is to change the mapping between the interworks.cloud and NetSuite entities, or to implement new push and pull methods that are not currently supported from our connector.
